APPARATUS AND METHOD FOR DELIVERY OF RINGING AND VOICE CALLS THROUGH A WORKSTATION

ABSTRACT OF THE DISCLOSURE

A data processing system comprises an audio processing means receiving data within said data processing system for converting the data into an analog signal with a first and a second analog channel components; an audio output means receiving the analog signal and providing a first and second output signal wherein the first output signal is provided for a loudspeaker and the output second signal is provided for a headset. The control of the audio processing means by a control signal providing an audio signal on the first or on the second channel or on both.
